

easy website. easy hosting.

**easyname**

Configuration Instructions

**Thunderbird**

If you follow these instructions, you will then be able to retrieve and manage your easyname e-mail inboxes with this e-mail client.

**Please note:** For this functionality of your mailbox to exist, you must obtain a paid hosting package from us. With a free hosting, you can only access and manage your mails via our webmail. (<https://webmail.easyname.com>)

First open Mozilla Thunderbird and click the button at the top-right to reach the menu (=burger menu with three lines). Next choose **Options > Account settings**. At the bottom-left you'll find the setting **Account Actions** where you can choose „**Add Mail Account...**“ as you see on this Screen:

The automatic check will probably fail because the configuration needs to be done manually in some cases. Therefore, we explain how to set-up everything manually.

Please click on **manual config** as shown in the Screenshot below if the automatic setup failed.

Now complete the form „**Set Up an Existing Email Account**“ as shown in the next Screen and make sure that you activate SSL encryption as well as “Password” or “Autodetect” for Authentication method:

Set Up an Existing Email Account

Your name:  Your name, as shown to others

Email address:  Your existing email address

Password:

Remember password

The following settings were found by probing the given server

	Server hostname	Port	SSL	Authentication
Incoming: IMAP	imap.easyname.com	993	SSL/TLS	Autodetect
Outgoing: SMTP	smtp.easyname.com	465	SSL/TLS	Autodetect

Username: Incoming:  Outgoing:

You can find all Data in your Controlpanel at **[Webhosting]** -> **[Datasheet]** given that you created your E-Mail addresses beforehand.

Please also make sure that you select the correct Mailserver-Type (either IMAP or POP)

Choose **POP**, if you want to download all E-Mails locally to your Device and **IMAP**, if you prefer to store all E-Mails on our Server and to keep everything synced.

You have to edit the Incoming Server address to either **pop. or. imap.easyname.com**

The outgoing Server is always **smtp.easyname.com** with **SSL** Encryption and Port **465**. Please also use the Mailbox Number as shown in the Screenshot above.

Now just click on **Re-test** and if the test was successful you're finally able to manage your E-Mails with Thunderbird.

Thank you for choosing us as your domain and hosting partner and good luck with your website.
